

Cleaning, Protecting and Maintaining Natural & Artificial Stone, Ceramics & Porcelain

Finding the right products to clean, seal and maintain your surface will ensure that your tiles and surfaces continue to look their best and remain problem free.

① Cleaning

When required to restore the original appearance and properties of existing tiles and floors which may require an occasional refresh or deep clean.

To carry out the initial pre-clean on installation and resolve dusting and contamination before the sealing process.

To deep clean areas with heavy contamination where restoration and refurbishment is required.

② Protecting / Sealing

The purpose of protective treatments (impregnators/sealants) is to provide oil, water and grease repellence. These deposits remain on the surface.

By preventing the dirt and moisture from penetrating, marking and staining is avoided and keeping the surface clean is much easier and quicker.

Pre-sealing may be required before grouting to prevent discolouration from 'picture framing' or surface contamination where grout pigment or moisture may bleed into the edges and/or surface of the stone or tile.

Surfaces should be clean and completely dry prior to sealing.

③ Maintaining

Maintaining the appearance with the correct care products will retain the natural beauty and condition of stone and tile surfaces for a long period of time.

Care needs to be taken to ensure that the correct specific care products are used as the importance of regular long-term maintenance is vital to keeping surfaces looking good and enhancing the effective action of protective treatments.

Please view the individual Method Statements for detailed Instructions by Surface Type.
